

This project is an interactive web experience designed to critically examine the fleeting nature of modern digital news through the lens of gamification. Its design language deliberately employs a style characterized by minimalism, brutalism, and high contrast. By stripping away traditional UI redundancies—such as menus, sidebars, and buttons—the design focuses the user's attention entirely on the contrast between the tangible "game" world in the foreground and the overwhelming "information" world in the background.

Color Palette

The color system for this project follows the principle of "Black Background, Highlighted Foreground." The background remains strictly pure black—static and unchanging—while all visual focal points, typography, and ambient lighting effects are entirely dictated by the theme color of the currently "active news category."

1. Base Colors (Static)

Underlying colors that persist globally and remain constant regardless of interactive states:

The Void Background: Pure Black #000000

Scope: The foundational background layer of the entire webpage, serving to provide visual contrast.

The Reader (Player Entity): #ffffff (Pure White) & #000000 (Pure Black)

Scope: The player-controlled character. The sphere itself is pure white, accented by a subtle white outer glow; the internal "directional eye" is pure black.

2. Dynamic Category Accents

The classification of news data directly determines the dominant color scheme of the visual interface. Based on the design prototype, the specific color values for the following categories are defined as follows:

- **ECONOMY:** #ffa502 (Bright Orange)
- **ENV** (Environment): #ffffff (Pure White)
- **POLITICS:** #a29bfe (Soft Lavender)
- **TECH** (Technology): #2ed573 (Digital Green)

Screen Element Color Mapping Mechanism

When Player controls character to jump and land on a specific platform, the colors of the entire screen are rendered strictly according to the following rules:

1. Background Information Layer (The News Layer)

When landing on a platform of a specific category (e.g., "ECONOMY"):

Inherit the current category's color (e.g., bright orange) to maintain visual consistency within the information group.

Main Headline (bg-title): Remains white, providing contrast against the category color.

Summary Body (bg-summary): Remains white, providing contrast against the category color.

Summary Left Border: Inherits the current category's color.

Metadata (bg-meta): Inherits the current category's color.

2. Foreground Physics Layer (The Game World)

Inactive Platforms:

Main Body Background: Dark gray (#222222).

Internal Text: Light gray (#888888).

Top Border: A solid line matching the color of its corresponding news category.

Active Platform (The platform currently beneath the player):

Main Body Color: Changes to the color of the current news category.

Internal Text: Changes to pure black (#000000).

Visual Feedback: Generates a strong outer glow within the same color family.

Fake News Platforms:

Main Body Background: Dark gray (#222222) with continuous glitch-jitter animation.

Animation Detail: Combines hue rotation, positional jitter, and alternating red/blue outline strobing.

Internal Text: Light gray (#888888), consistent with inactive real platforms.

Visual Signal: Animation persistently marks the platform as untrustworthy without removing its legible form.

Score Display:

Position: Fixed top-left corner, persistent across all game states.

Typography: font-weight: 900, font-size: 2rem, consistent with primary heading hierarchy.

Color: Pure white (ffffff) with low-opacity outer glow.

Visual Signal: Remains legible against all dynamic category background colors.
